

SITE ANALYSIS & LOAD TEST REPORT

The image shows a screenshot of a form titled "SITE ANALYSIS AND LOAD TEST REPORT" from PLATIPUS EARTH ANCHORING SYSTEMS. The form includes fields for client details, site information, and a large table for recording test results. A note at the bottom states: "Please read the Guidance Notes and other documents in the reverse of this document."

With the correct soil information we are able to predict accurate holding capacities of our earth anchors, normally within 10%.

In circumstances where soil information is not readily available we recommend that a Site Analysis and Load Test Report is completed. The information recorded on this report will build an accurate picture of the site's condition and the exact capabilities of the anchor system.

It will also identify other important considerations such as accessibility and the location of buried services. In most situations, a Site Analysis and Load Test Report is a service that we offer free of charge.
