

WIRE TENDONS

ROUND STRAND WIRE TENDON

Much of the wire tendon used for our light earth anchor system is of this type and is available in either galvanised steel, plastic impregnated or stainless steel.

COMPACTED STRAND WIRE TENDON

This form of nineteen individual wires (1 x 19), once compacted, creates a much higher density wire tendon. It gives better rigidity and lower stretch characteristics than conventional round strand wire tendons.

Used exclusively with T-Loc it is available in galvanised steel or stainless steel and is generally associated with higher load requirements.
